DUAL OPERATIONAL AMPLIFIER WITH SWITCH

■ GENERAL DESCRIPTION

The NJM2123 is a operational amplifier with analog switch (2 circuit of 2-input/1-output). It is applicable to the audio part for Video (VTR,LD...) and the Car-stereo.

The NJM2123 has the same electrical characteristic of the NJM2112,and is low saturation output type.

The mode of switch is improved from the current control type (NJM2120:1 circuit of 2-input/1-output) to the voltage control type. So, it is easy to use.

■ PACKAGE OUTLINE

NJM2123D

NJM2123M

NJM2123V

■ FEATURES

- Single Supply
- Operating Voltage (+4V~+20V)
- Slew Rate (3V/μs typ.)
- Analog Switch Function
- Wide Unity Gain Bandwidth (10MHz typ.)
- Package Outline DIP16,DMP16,SSOP16
- Bipolar Technology

■ PIN CONFIGURATION

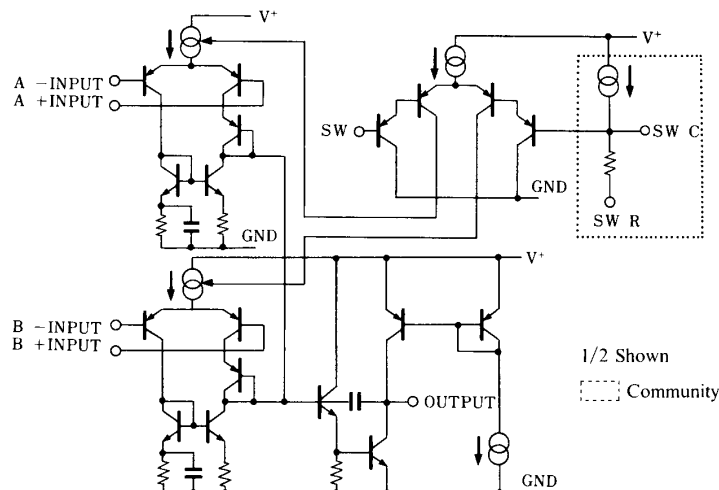

NJM2123D
NJM2123M

(note1) Applied circuit voltage gain is desired to be operated within the range of 3dB to 30 dB.

(note2) Special care being required for input common mode voltage range and the oscillation due to the capacitive load when operating on voltage follower.

(note3) "Crosstalk" is defined about leak of signal on the same circuit.

(note4) "Channel Separation" is defined about leak of signal between 2 circuits.

(note5) V_{th} is possible to adjust by external parts.

(note6) Voltage for V-PIN has to be supplied earlier than V^+ -PIN in case of two supply voltage.

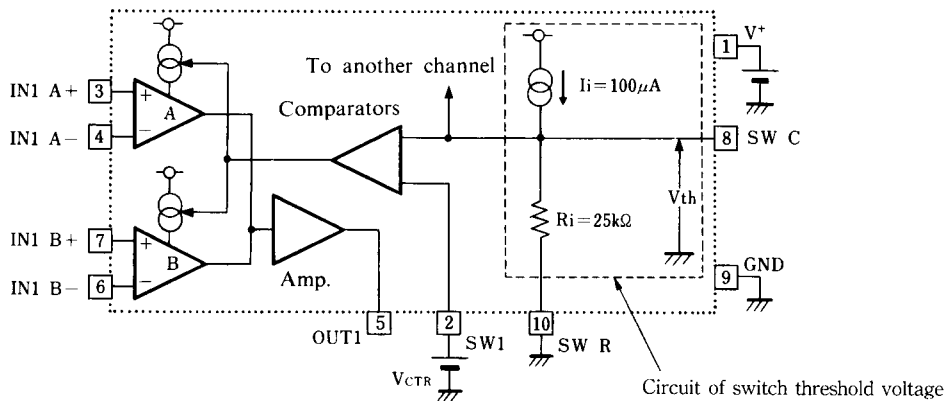

■ TYPICAL CHARACTERISTICS

In case of single supply voltage ($V^+=5V$)

■ SWITCHING MECHANISM

- in case of single supply voltage

The switch circuit of NJM2123 consist of comparators for switch and circuit for switch threshold voltage (V_{th}) due to establish threshold of comparator. $V_{th} = I_i \times R_i = 2.5V$ in case of above Figure.

Comparator selects INPUT (A or B) by compare of control voltage (V_{CTR}) and threshold voltage (V_{th}) and control of operating current of Amp (INPUT).

INPUT A is selected in case of $V_{CTR} > V_{th}$ and INPUT B is selected in case of $V_{CTR} < V_{th}$.

V_{CTR} can not be used between $V_{th} \pm 0.1V$ in order that signal of both INPUT A and INPUT B are mixed in case that V_{CTR} is near V_{th} .

NJM2123

■ ABOUT ADJUSTMENT OF V_{th}

The switch threshold voltage (V_{th}) is possible to adjust by external parts to SW C/SW R.It needs to be satisfy with condition of $V_{th} \leq V^+ - 2V$.

This reason is caused by equivalent circuit of comparator for switch.

The V_{th} has to be adjust in case that supply voltage is less than 5V (±2.5V).

Adjustment method is as following.

■ ADJUSTMENT OF V_{th}

In case of $I_i = 100\mu A, R_i = 25k\Omega, R_e$ (External Resistor)

● Internal V_{th} (Single supply)

● Internal V_{th} (Two supply)

● V_{th} > 2.5V (Single supply)

● V_{th} > 2.5V (Single supply)
