

HIGH POWER SP4T SWITCH GaAs MMIC

GENERAL DESCRIPTION

The NJG1809ME7 is a high power SP4T switch MMIC suitable for LTE-U / LAA, WLAN, and LTE applications. This switch features very low insertion loss and high isolation up to 6GHz and excellent linearity performance with 1.8V control voltage. This switch achieves high speed switching time for WLAN application. Integrated ESD protection device on each port achieves excellent ESD robustness. No DC Blocking capacitors are required for all RF ports unless DC is biased externally.

The small and thin EQFN18-E7 package is adopted.

APPLICATION CIRCUIT

Note:

- [1] No DC blocking capacitors are required on all RF ports, unless DC is biased externally.
- [2] The inductor L1 is optional in order to achieve enhancing ESD protection level. L1 is also recommended in order to keep the DC bias level of each RF port at ground level tightly.

PRECAUTIONS

- [1] No DC block capacitors are required for RF ports unless DC is biased externally. When other device biased at certain voltage is connected to the NJG1809ME7, a DC block capacitor is required between the device and this switch IC. This is because the each RF port of this switch is biased at ground level.
- [2] For avoiding the degradation of RF performance, the bypass capacitor (C1) should be placed as close as possible to VDD terminal.
- [3] For good RF performance, all GND terminals are must be connected to PCB ground plane of substrate, and through holes for GND should be placed near the IC.
- [4] Please connect Exposed PAD to PCB ground plane of substrate, and through holes for ground should be placed under the IC.
