Low Output Voltage Low Dropout Regulator

**GENERAL DESCRIPTION**

The NJM2841 is a low output voltage, low drop out regulators. It delivers up to 500mA output current with the output voltage of 0.8 to 2.5V. The use of an external bias voltage can improve the transient response and the ripple rejection characteristics while maintaining minimum input to output voltage.

**FEATURES**

- Output Voltage Range 0.8V to 2.5V
- High Ripple Rejection 86 dB typ. (V_O=1.2V version)
- Output Noise Voltage V_NO=40µVrms (V_O=1.2V version)
- Output Current I_O(min)=500mA
- High Precision Output V_O±1.0%
- Dual Supply Voltage Type V_IN, V_BIAS (sequence free)
- High Stability for Load 0.002%/mA (max)
- Output Capacitor with 4.7µF ceramic capacitor
- Low Dropout Voltage 0.1V typ. @I_O=300mA
- ON/OFF Control
- Built-in Thermal Overload Protection and Over Current Protection
- Bipolar Technology
- Package Outline SOT-23-5, SOT-89-5

**PIN CONNECTION**

- 1. CONTROL
- 2. GND
- 3. V_OUT
- 4. V_IN
- 5. V_BIAS

**BLOCK DIAGRAM**

The NJM2841 is a low output voltage, low dropout regulators. It delivers up to 500mA output current with the output voltage of 0.8 to 2.5V. The use of an external bias voltage can improve the transient response and the ripple rejection characteristics while maintaining minimum input to output voltage.

### TEST CIRCUIT

- **VBIAS**
- **GND**
- **CONTROL**
- **VOUT**
- **VIN**
- **VOUT**
- **ICONT**
- **0.1µF**
- **4.7µF**

### TYPICAL APPLICATION

**a)** In case of where ON/OFF control is not required:

- Connect control pin to **VBIAS** pin.
- Though the **ICONT** decreases by inserting "R" to between Control pin and **VBIAS**pin, the minimum operating voltage is increased due to the resistor "R".

**b)** In use of ON/OFF control:

- State of control pin:
  - "H" → output is enabled.
  - "L" or "open" → output is disabled.
* Bias Capacitor $C_{BIAS}$ and an Input Capacitor $C_{IN}$

$C_{BIAS}$ and $C_{IN}$ are required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use recommended $C_{BIAS}$ and $C_{IN}$ value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between $V_{BIAS}$ - GND, $V_{IN}$ - GND as shortest path as possible to avoid the problem.

*Output Capacitor $C_O$

Output capacitor ($C_O$) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller $C_O$ may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger $C_O$ reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended $C_O$ value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and $V_{OUT}$ as shortest path as possible for stable operation.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting $C_O$, recommend that have withstand voltage margin against output voltage and superior temperature characteristic though this product is designed stability works with wide range ESR of capacitor including low ESR products.
