

OUTPUT COUPLING CAPACITOR-LESS LOW VOLTAGE VIDEO AMPLIFIER WITH LPF

■ GENERAL DESCRIPTION

The NJU71032 is a Low Voltage Video Amplifier with LPF circuit. By the internal charge pump circuit, output capacitor is unnecessary.

The NJU71032 features low power and small package, and is suitable for low power design on downsizing of portable video system and system with video output.

- NJU71031 (Gain=6dB)

■ PACKAGE OUTLINE

NJU71032RB1
MSOP8(TVSP8)

■ FEATURES

- Operating Voltage 2.5 to 3.45V
- Output coupling capacitor-less
- 6dB amplifier
- Internal 75Ω Driver Circuit (2-system drive)
- Internal LPF 0dB at 6.75MHz typ
 -40dB at 54MHz typ
- Power Save Circuit
- CMOS Technology
- Package Outline MSOP8(TVSP8)*

*MEET JEDEC MO-187-DA / THIN TYPE

APPLICATION

When coax multiplex transmission, we recommend that you adjust the output signal. Please refer to figure1.

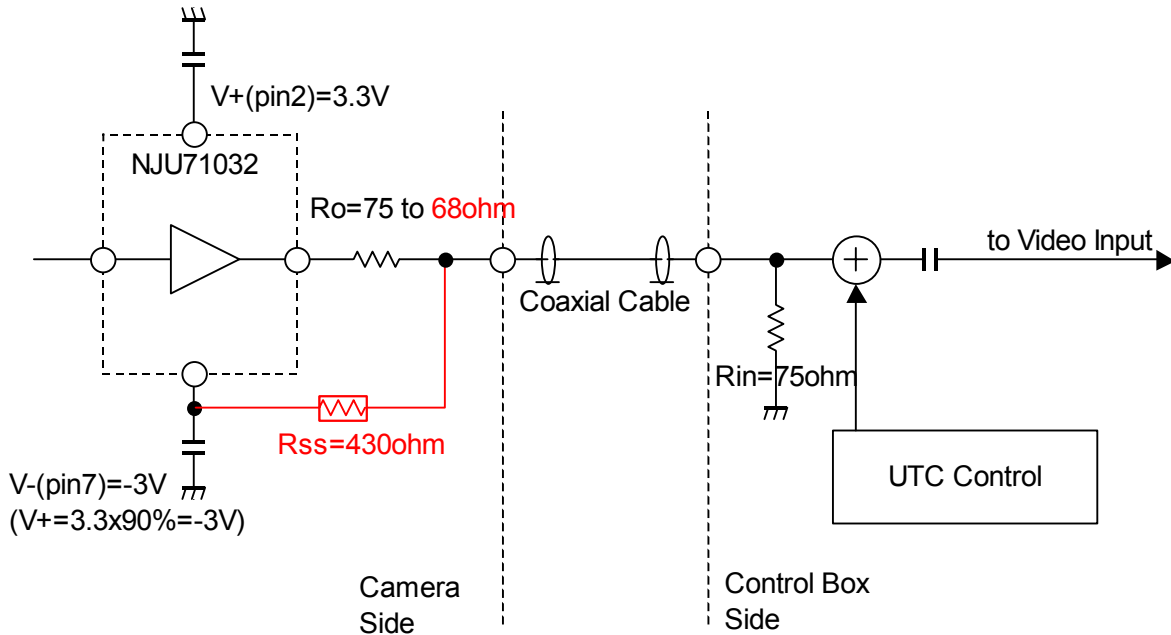

Figure1: How to shift the output DC signal

The rare case, there is to be superimposed the directly DC control signal on the video signal when superimposed a control signal to the video signal by using a coaxial cable.

In that case, the following symptoms will appear.

- The control signal appears on the screen.
- Loss of synchronization of the video signal

Shows the proposed measures on the next page.

A case of multiple coaxial transmission: UTC(Up The Coaxial)

This is one of a case at the multiplex coaxial transmission used in CCTV.

It is a system that control signals of camera multiplexing to the coaxial cable.

This system is superimposed on the control signal pulse in the vertical blanking period as shown in Figure 2.

This is because do not affect the video signal.

Case of Coaxitron

Figure2: A case of UTC

Ver.2

Proposed measures is shift the output DC signal by using the V- terminal (pin 7) of NJU71032.

The steps are as follows:

1. A resistor: Rss add between the Ro (75Ω) and V- terminal (7pin).

2. Reduce Ro (75Ω).

By adding a Rss, level of the video signal is attenuated.

Example: Level of the video signal will be reduced 5% at connected Rss = 430Ω and Ro = 75Ω.

Therefore, increase 5% of video output level by changed to 68Ω the Ro.

*Table 1 shows an external resistor value and the swing of video output signal at V+ (pin2) = 3.3V, 3V.

3. Please evaluation of S/N.

It is because the noise of the charge pump may change.

	Value (typ.)		UNIT
V+(pin2)	3.3	3	V
V-(pin7) (V+*90%)	-2.95	-2.67	V
Termination resistance	75	75	ohm
Resistance (between Vss and Vout)	430	430	ohm
Output resistance(Ro)	68	68	ohm
Sync. Voltage of Vout	-0.203	-0.19	V
Swing of Vout	0.975	0.975	Vpp

Table 1: external resistor value and the swind of video outout signal at V+ (pin2) = 3.3V, 3V.

• Case of 2-system 75ohm drive

Shown in Figure 3, 2-system drive will be possible at system 1 (75Ω for multiplex coaxial system) and system -2(75Ω system for monitoring).

However, shown in Figure 4, 2-system drive is not recommended, case of system 1and 2 (75Ω for multiplex coaxial system)
