

## Unipolar Stepper Motor Driver

### □ GENERAL DESCRIPTION

The NJW4351 is a high efficiency DMOS unipolar stepper motor driver IC. Compared to previous devices, it is more suitable for low voltage operation, capable of handling 5.0V, 3.3V and the like logic circuits. Drive Stage consists of DMOS which produces high efficiency and low heat generation motor drive circuit.

The motor can be controlled by the STEP and DIR system. Further more, to improve controllability of system, MO, ENABLE, RESET and PD function are included, various applications are possible.

### □ PACKAGE OUTLINE

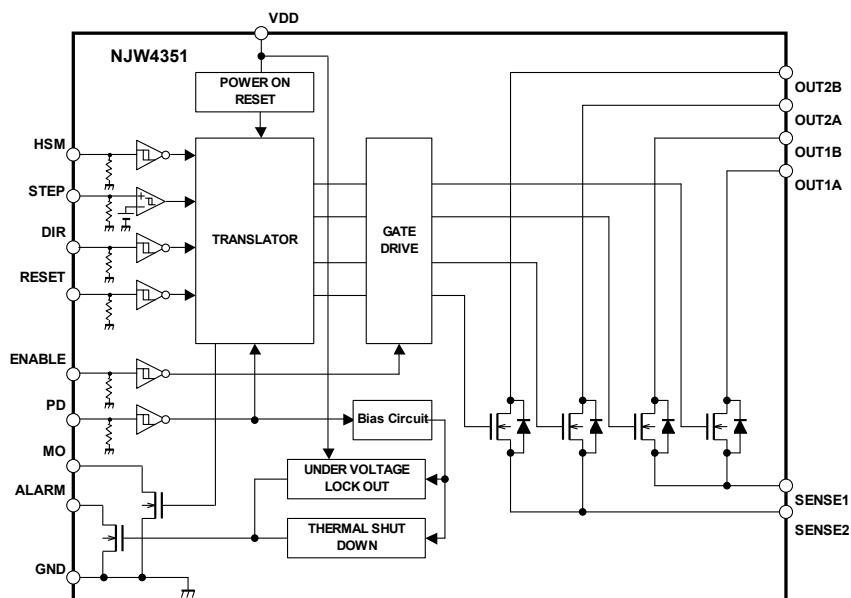

NJW4351VC3

### □ FEATURES

- Supply Voltage  $V_{DD}=2.7$  to  $5.5V$   
 $V_{MM}=$  to  $55V$
- Output Current  $I_o=1.5A$  peak at  $V_{DD}=5V$
- Low Quiescent Current  $I_{DD}=500\mu A$  typ.
- STEP&DIR Input Operation (Internal Translator)
- HALF/FULL Mode Generation
- TTL compatible Input With Schmitt-Comparator
- ENABLE Function
- RESET Function
- MO (Motor Origin Monitor) -Position-indication Output
- PD (Standby) Function
- Under Voltage Lock Out
- Thermal Shutdown Circuit
- Alarm Output Function (As the protection circuit operates)
- BCD Technology
- Package Outline SSOP20-C3

## □ PIN FUNCTION LIST

Pin#	Terminal Name	Function	Remark
SSOP20-C3			
1	PD	Power Saving State Setting Input Terminal	L=Standby, H=Normal Operation
2	VDD	Logic Voltage Supply Terminal	Logic Voltage Supply
3	HSM	HALF/FULL Step Mode Setting Input Terminal	L=FULL, H=HALF
4	STEP	Stepping Pulse Input Terminal	The Translator is triggered by positive edge of STEP Pulse.
5	DIR	Direction Setting Input Terminal	L=FORWARD, H=REVERSE
6	RESET	Reset Input Terminal	L=The Translator is initialized, H=Normal Operation
7	ENABLE	Phase Output Off Input Terminal	L=ACTIVE, H=Normal Operation
8	MO	MO Output Terminal	When the Translator is in initial status, L level is to output.
9	ALARM	Internal Protection Operation Detection Output Terminal	When the internal protection operation is detected, L level is to output.
10	GND	Logic Ground Terminal	Logic Ground
11,12,19,20	N.C.	No Connection	No Connection
13	OUT2A	2ch Output Terminal A	—
14	SENSE2	Current Detection Resistance Connection Terminal 2	It connects resistance for the detection of the side of 2ch. At the unused time, it connects with GND.
15	OUT2B	2ch Output Terminal B	—
16	OUT1B	1ch Output Terminal B	—
17	SENSE1	Current Detection Resistance Connection Terminal 1	It connects resistance for the detection of the side of 1ch. At the unused time, it connects with GND.
18	OUT1A	1ch Output Terminal A	—

## □ ABSOLUTE MAXIMUM RATINGS

## □ FUNCTION DESCRIPTION

The NJW4351 is designed for a high-performance constant-voltage unipolar stepper motor.

Using a general-purpose STEP&DIR motion controller, the device can easily control a stepper motor when combined with a pulse generator.

The maximum value of the phase output is 55 V that keeps the voltage margin of the motor from exceeding the limit, which is a common problem with unipolar winding systems. It simplifies the design of power control circuits during phase turn-off.

## □ LOGIC INPUT BLOCK

All inputs are LS-TTL compatible. Input Block1 (STEP) has Schmitt Comparator to keep the thresh voltage unchanged even if logic supply voltage applied to it varies. It produces hysteresis voltage for noise immunity. Input Block2 (PD, DIR, HSM, RESET, ENABLE) has Schmitt Inverter for the main purpose of noise immunity.

Inputs are internally connected to GND by pull-down resistances, being open, the device recognizes to be low.

### • STEP – Stepping Pulse

The Translator starts counting on every positive edge of the STEP. In full step mode, the pulse turns the stepper motor at the basic step angle. In half step mode, two pulses are required to turn the motor at the basic step angle.

The DIR (direction) signal and HSM (half/full mode) are latched to the STEP positive edge and must therefore be established before the start of the positive edge.

### • DIR – Direction

The DIR signal determines the step direction. The direction of the stepper motor depends on how the NJW4351 is connected to the motor. DIR can be modified anytime, it miss-steps when it is simultaneous with the positive edge.

### • HSM – Half/full Step Mode Switching

This signal determines whether the stepper motor runs at half step or full step mode. The Translator is set to half step mode when HSM is low. Like DIR, HSM can be modified anytime but not when its simultaneous with the positive edge.

### • ENABLE – Phase Output Off

All phase outputs are turned off when ENABLE goes high reducing power consumption.

### • RESET

A two-phase stepper motor repeats the same winding energizing sequence every angle that is a multiple of four of the basic step. The Translator is repeated every four pulses in full step mode and every eight pulses in half step mode.

When RESET is low, the Translator is initialized and the phase outputs turn-off.

When returning to high, the phase outputs are set to the initial energizing pattern output status.

### • PD-Power Down

When PD goes low, it forces all settings to initialize and be in stand-by mode.

AND MO is to be low.

# NJW4351

---

## □ **POR – Power On And Reset Function**

The POR connected to VDD is to prevent miss-step under unstable condition of the inputting of logic supply voltage VDD.

After inputting VDD, the phase outputs are set to the initial energizing pattern output status.

## □ **PHASE OUTPUT BLOCK**

The phase output block consists of four open-drain DMOS FET capable of sinking max 1.5A.

## □ **MO – Motor Origin Monitor**

In initialized position of the Translator, MO output low to indicate to external devices that it is the initial energizing pattern output status.

## □ PRECAUTIONS

1. Never disconnect the device or PC-board when power is supplied.
2. Remember that excessive voltages might be generated by motor, even though clamping diodes are used.
3. Choose a motor that is proportional to the current you need to establish desired torque. A high supply voltage will gain better stepping performance. If the motor is not specified for the VMM voltage, a current limiting resistor will be necessary to connect in series with center tap. This changes the L/R time constant.
4. Avoid VMM and VDD power supplies with serial diodes (without filter capacitor) and common ground with VDD.
5. To change actual motor rotation direction, exchange motor connections at OUT1A and OUT1B (OUT2A and OUT2B).
6. Half-stepping  
In the half-step mode, the power input to the motor alternates between one or two phase windings. In half-step mode, motor resonances are reduced. In a two-phase motor, the electrical phase shift between the windings is 90 degrees. The torque developed is the vector sum of two windings energized. Therefore, when only one winding is energized, which is the case in half-step mode for every second step, the torque of the motor is reduced by approximately 30%. This causes a torque ripple.
7. Drive Circuits  
High-performance stepper motor operation requires windings to be energized immediately at phase turn-on and quickly turned off when not in use.
8. Phase Turn-off Considerations  
When the winding current is turned off, induced high voltage spike will damage the drive circuits if not properly suppressed.  
Refer to the description of turn-off circuit as follow.

# NJW4351

## < About the turn-off circuit >

There are various turn-off circuit methods for the purpose of extracting the speed performance of the motor.

The turn-off time of motor current depends on the clamp voltage of the turn-off circuit.

Therefore, it is necessary to select an appropriate turn-off method according to the motor speed.

However, the larger the clamp voltage of the turn-off circuit, the negative voltage is generated by electromagnetic induction to the other winding.

Method	Diode Turn-off	Resistor + Diode Turn-off	Zener Diode + Diode Turn-off
External parts scale	Small	Medium	Large
Motor Speed	Low	High	
Negative voltage value	Low	Middle to High	

## < Prevention of Malfunction for Negative Voltage >

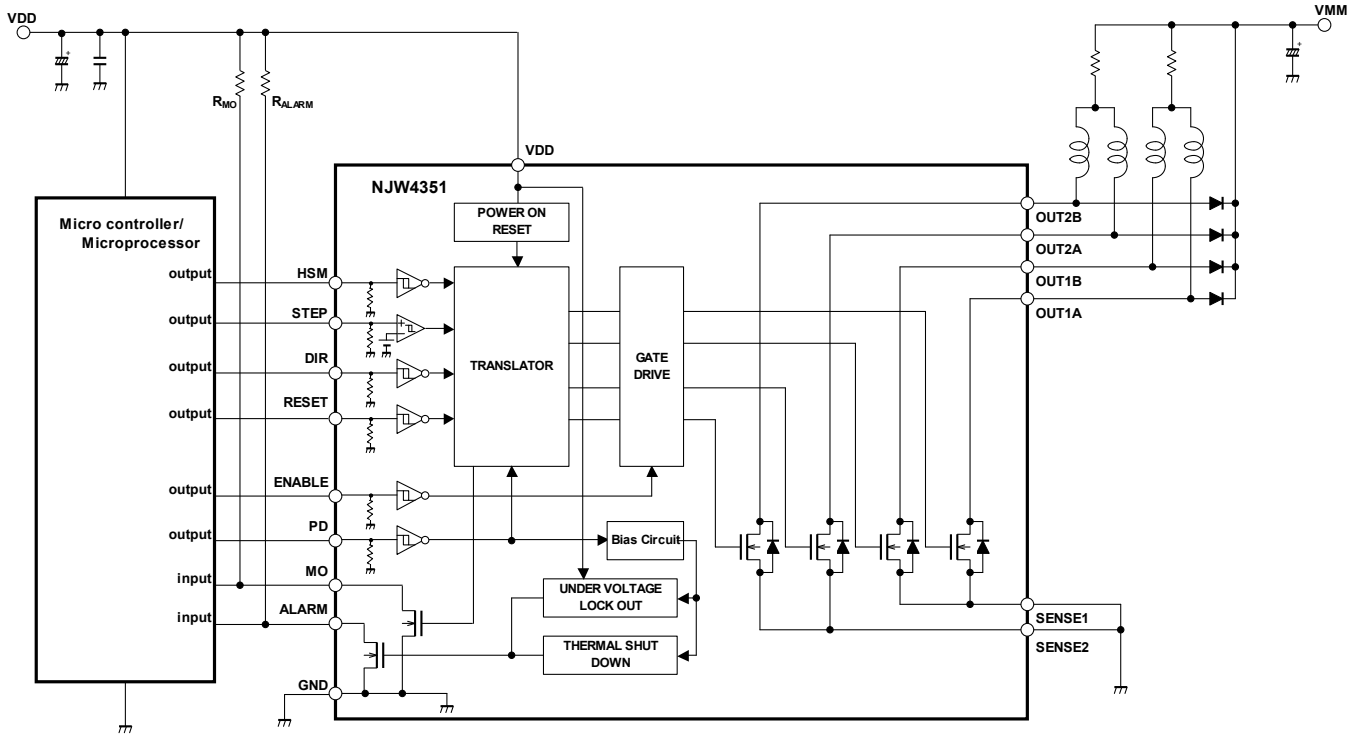

In unipolar motor drive, when switching the winding current electromagnetically coupled, the output pin may become below the GND potential due to long wiring of the motor, routing of the GND wiring of the mounting board, turn-off circuit type, and so on.

Due to the nature of the monolithically structured IC, when a large negative voltage is applied to the output pin, the inside of the IC may cause unexpected operation, which may cause circuit malfunction (miss step).

Therefore, in order to reliably prevent circuit malfunction due to negative voltage, it is recommended to insert a diode in series at the output pin and take countermeasures.
